The applicant argues that Ramasubramani et al. does not focus on or provide any information on the persistent connections between the proxy and the servers that supply the objects requested by the users.

Ramasubramani et al. teaches centralized network access for wireless network carriers providing network access to wireless communication devices. Ramasubramani focuses on connections between proxy and users and between proxy and servers, wherein proxy is shown in Fig. 2, Ref # 214.

Ramasubramani provides information on persistent connections 208, 210, and 212 as shown in Fig. 2, wherein users 202, 204, and 206 request information from internet 216, wherein controller 214 delivers requested information from servers 218, and 220 over the internet through persistent connections to users 202, 204, and 206

Ramasubramani et al. further teaches allocating the requests to the plurality of persistent connections and for transmission to the one or more servers, [Fig. 2, users 202, 204, and 206 seek information from application server located on the internet 216 through persistent connections 208, 210, and 212, whereinthe NB-router 810 also operates to route acknowledgments or original requests from a particular wireless device to the appropriate airlink in the pull agent 804, (Col. 11, Lines 33-43).

Ramasubramani et al. further teaches a plurality of persistent connections coupled with the proxy, where the plurality of persistent connections are connections between the proxy and one or more servers over a distributed network that are activated and maintained by the proxy, [Fig. 6, Connections between Ref # 602 & 208, between # 602 & 216 are persistent connections.
